ACTIVITY 5

The bill arrived

Fourteen days of one fictional bank's agent costs. Something changes in the middle. Work in pairs.

Day	Cases handled	Model calls	Cost (EUR)	Cost per case	What changed? (busy day, model change, new feature, loop, don't know)
1	400	2,000	38		
2	410	2,050	39		
3	390	1,950	37		
4	405	2,030	48		
5	395	1,980	47		
6	640	3,200	76		
7	420	2,100	50		
8	410	2,300	58		
9	415	2,330	59		
10	400	9,100	205		
11	410	31,000	705		
12	395	33,500	760		
13	400	12,000	270		
14	405	2,320	59		

- **1.** Read the ledger without calculating (4 min). **2.** Circle every day where something changed and write what you think it was. Work out cost per case for two days that look odd (4 min).
- **3.** Write one budget rule on the next page (5 min). **4.** Swap with another pair and test the rule you are given against the three probe days (4 min).

ACTIVITY 5

Your budget rule

Form: **If [measure] is more than [limit] for [time], then [stop or slow what, and page whom].** A rule that only alerts must say who reads it at night.

If

is more than

for

then

and page (a role)

Testing a rule you were given

Use only the rule on the sheet you were handed. Do not ask the authors what they meant.

Probe day	What the rule should do	What it does	Right?
Day 6: month-end rush, cases up 60 per cent, cost per case unchanged	Nothing. Not a problem		
Day 10 onwards: two agents start a clarification loop, cases flat	Stop within hours and page a person		
Day 4: the model alias moves to a newer version	Notify the owner of the configuration record. Do not stop the service		

Put a dot on the wall: how many of the three probes did the rule get right?
