ACTIVITY T | FINOPS FOR AGENTS

Tag it and route it

Work in pairs. One customer request to the Day 3 mortgage agent becomes eight model calls. **"I'm worried about next month's payment. Can someone call me tomorrow?"** Prices are fictional: larger model EUR 3 in and EUR 15 out per million tokens; smaller model EUR 0.30 and EUR 1.50; embedding model EUR 0.05 in. **Task 2** is the table: for each call, say whether a smaller model could do it, and the test you would run before moving it.

#	Model call	Model today	Tokens in / out	Cost (euro cents)	Could a smaller model do it? (S, L or ?)	The test you would run before moving it
1	Classify the intent	Smaller	400 / 20	0.015		
2	Embed the question for search	Embedding	60 / 0	under 0.001		
3	Check for signs of financial difficulty	Smaller	700 / 50	0.028		
4	Plan the reply and the tool steps	Larger	2,500 / 600	1.650		
5	Draft the reply	Larger	3,000 / 500	1.650		
6	Check tone and policy	Smaller	900 / 80	0.039		
7	Plan again after the callback tool timed out	Larger	2,500 / 600	1.650		
8	Summarise the conversation into memory	Larger	3,500 / 300	1.500		
	Whole request			**6.53**		

Task 1. Write the four tags every call should carry, so that finance can answer "what did this one customer's request cost?" and operations can answer "which version was running when the bill moved?"

Tag 1		**Tag 2**		**Tag 3**		**Tag 4**	

Task 3. Circle the one call where moving to a cheaper model changes the *risk*, not only the cost. Write why in one line:

_____
