ACTIVITY F | AGENTOPS

Fail on purpose

Work in pairs. Choose **three** of the six failures. For each, write the plan you would run in a test environment before go-live. Then swap with another pair. They mark one thing: **would you actually know the failure had been injected, and what happened?**

Failure	Inject: how, in staging	Expect: loud, contained, escalates	Look: what the trace should show	Tell: who is told before you inject	Stop: when you end the test	Swap: would you know? Y / N
1 A tool call times out (callback scheduling)						
2 The memory store is unavailable						
3 Retrieval returns a malformed or poisoned passage						
4 One sub-agent drops out part-way						
5 A pasted letter hides an instruction						
6 The model alias moves to a new version						

The rule. You inject in a test environment, never first in production, and the owner is told before you start. A failure test nobody expected is an incident.
