ACTIVITY S | GUARDRAILS

Count, then turn the dial

Count your results	How many
Caught (attack, blocked)	
Missed (attack, passed)	
Wrongly blocked (customer, blocked)	
Rightly passed (customer, passed)	

Missed ÷ real attacks = _____ ÷ _____ = _____ (how often it lets one through)

Wrongly blocked ÷ genuine requests = _____ ÷ _____ = _____ (how often it stops a customer)

Now turn the dial. Someone tightens the filter so it blocks more. Your facilitator will tell you what it does to the twelve messages. Write the new numbers, then answer:

	Missed ÷ real attacks	Wrongly blocked ÷ genuine
Threshold 0.50		
Tightened		

Who pays for the extra blocks, and who would notice? _____

Which of the missed attacks would an **action** guardrail or a **human** have stopped? _____

What would you want measured, and by whom, before you trusted this filter on its own? _____

The twelve messages are a small sample taken from the labelled test set in the live demo. Real error rates need far more cases, and the numbers are specific to this filter and this configuration.
