Day 2 · Tendering and safety

# AI for Business Operations

Tenders, method statements and risk assessments

Doing and Learning · Kevin Cunningham

# What you will be able to do by 4:30

1. Turn a prompt that works into a reusable skill
2. Build skills for PQQ answers and tender checks
3. Build a safety skill with a competent person in charge
4. Package your skills in a plugin with an owner

# How today runs

Breaks at 10:55 and 15:00. Lunch 12:30 to 13:15. Finish 16:30.

# Yesterday, and what we built

Better prompts: role, context, task, format, limits

Every answer checked against the source

A plugin for a programme of construction

Confidential data kept out unless approved

Who tried something since yesterday?

# A skill is a workflow you write down once

Your best prompt, saved with its checks

Anyone on the team can run it

It says what to use, what to do and what to check

A plugin is the box that holds your skills

# What is inside a skill

**Name** and a description of when to use it

**Steps** what to do, in order

**Facts** reference files it may use

**Limits** what it must never do

**Check** what a person confirms before use

# It is never the finished article

**1 Run** the skill on a real example

**2 Spot** what it missed, invented or got wrong

**3 Fix** the skill, so the gap is covered next time

**4 Re-run** the same example to see if it worked

**5 Note** what changed, the date and who approved it

Every gap you spot goes back into the skill or plugin, so it is covered next time.

# Projects, skills and plugins

**Project** files and instructions for one job

**Skill** a repeatable procedure with its checks

**Plugin** a package of skills you can share

Custom GPTs are being retired. Skills and plugins are the replacement.

# Skills you could build today

## Tendering

- PQQ answers
- Tender compliance
- Tighten to word limit
- Case studies
- Clarification questions

## Site and safety

- Method statement layout
- RAMS reviewer
- Toolbox talks
- Environmental checklist
- Lessons-learned note

## Office

- Programme of construction
- Minutes to actions
- Contract clause summary
- Weekly site report
- Plain English rewriter

Pick one that you would use next week. Safety skills carry a guard.

# The five-step workflow

**1 Gather** the source documents and facts

**2 Brief** role, context, task, format, limits

**3 Draft** let the model produce a first version

**4 Check** against the source, by a named person

**5 Save** keep the prompt that worked

Worked example

# From a vague ask to a usable draft

Weak: "Write our approach to quality"

Better: the five parts, plus the invented tender extract

Then: "What did you assume?" and fix the gaps

# Build a PQQ answer bank

Collect your best past answers in one file

Group them by topic, not by tender

Ask the model to adapt, never to invent

Date each answer and name an owner

Facts such as turnover, accreditations and insurance need a human update every time

Lab 2.1

# PQQ answer skill

Write a skill that drafts PQQ answers from an answer bank

Tendering team. Safety team: take the same lab with the H&S questions.

# Award criteria and compliance

List every requirement, one per row

Note where your response meets it

Flag gaps, assumptions and clarifications

Score weighting tells you where to spend words

A person reads the tender pack. The matrix is only a map.

Lab 2.2

# Tender compliance skill

Write a skill that extracts requirements and flags gaps

Then check the list against the original, line by line

Afternoon

# Why safety documents are different

A wrong sentence can hurt someone

The model has never seen your site

A competent person writes and signs off

AI helps with structure, wording and checking

Safety

# A safety skill needs a guard

It must not decide hazards or controls

It marks anything unknown in [square brackets]

It never says a task is safe or compliant

It ends with a checklist for the competent person

# Method statements

You supply the sequence of work and the controls

The model organises, clarifies and fills the template

Ask it what steps or controls look missing

Walk the site and sign off

# Risk assessments and toolbox talks

You identify hazards on site, not the model

Use it to prompt: "what else might I have missed?"

Turn the signed assessment into a short toolbox talk

Plain words, short sentences, real examples

# Quality and environmental papers

Inspection and test plans: structure and consistency

Environmental plans: plain-English summaries

Non-conformance reports: clear, factual wording

Specifications stay the authority. Check against them.

# A Project for each department

**Tendering** answer bank, templates, past bids

**Safety** templates, house style, checklists

**Accounts and trading** your own use case

One owner per Project, reviewed every quarter

Lab 2.8

# Package your skills

Put two skills in one plugin, with an owner and a review date

If you cannot install a plugin, keep the skills in a Project instead

# Rolling it out

**Decide** approved accounts and the AI-use policy

**Pilot** two or three tasks, a small team, 30 days

**Measure** time saved and errors caught

**Index** one page saying what each file is for, with an owner

**Share** the skills that work, with one named owner

# Your 30-day plan

**Week 1** Agree accounts, settings and the policy

**Weeks 2–3** Run your pilot tasks with checks

**Week 4** Review results and share prompts

Thank you. Questions?

# Draft, then tighten to the limit

Write for the scoring, not for yourself

Give evidence: who, where, when, how much

Ask for 500 words, then 350, then 200

Count the words yourself

# Case studies from project notes

**Challenge** what was hard

**Action** what you did

**Result** numbers the client can see

**Relevance** why it matters to this bid

Lab 2.3 follows this slide
