TABLETOP: A CUSTOMER-FACING AGENT

CSOB is piloting a customer-facing agent that answers questions about mortgage products and can, within limits, update a customer's contact preferences and schedule a callback.

It can reach three things

- A product-information knowledge base (retrieval)
- A customer contact-preferences system (read and write)
- A callback-scheduling tool (write)

Roles (groups of four)

- **Sandbox owner:** decides the narrowest scope of each tool.
- **Escalation owner:** owns the trigger your group wrote at 14:40.
- **Incident commander:** speaks for the group on each event. Changes every event.
- **Scribe:** fills in the response sheet and the configuration record.

Step 1: define the tool sandbox (12 minutes)

Tool or system	Narrowest scope that still lets the agent do its job	What it must never be able to do
Product knowledge base		
Contact-preferences system		
Callback-scheduling tool		

RESPONSE SHEET

The facilitator reads each event aloud. You have 90 seconds of silent writing. Write what your design does. Another group will later mark in red what it missed.

Event	What our design does	What the other group says it missed
1		
2		
3		
4		

Event 4 only: which entry of the configuration record changed, and who would have been told?
