Lab 2.7: Department Projects

Time: 25 minutes. Material: your answer bank, your skills, your checklists, handouts/workflow-card.pdf.

A Project grounded in your own files gives more consistent drafts than a blank chat. In this lab each group builds one.

Tendering group: build a PQQ and tender helper from your answer bank. Safety group: build a method statement and risk assessment reviewer from your checklists.

Your Task

1. Create a Project and name it for the job.
2. Write the instructions: the role, which files it must use, what it must flag, that it must not invent facts, and the format of its answers.
3. Add your reference files. Use only invented or anonymised material in this session.
4. Write an index file: a one-page table with one row per file showing what it contains, what to use it for, what not to use it for, its owner and when it was last updated. Add a line saying which file wins if two disagree. Add it to the Project and tell the instructions to read it first.
5. Test it with two prompts. Make the second one ask for something the files do not contain and check that it flags the gap.
6. Write down who owns each file and the index, and how often they will be updated.

Outcome

Your group has a working Project with written instructions, an index file, a list of files to keep up to date and an owner for each.
