Lab 2.8: Package your skills

Time: 25 minutes. Material: the skills you wrote today, handouts/skill-template.docx.

A plugin is the box that holds your skills so a team can use the same set. In this lab you package two skills, give them an owner and test them. Nothing confidential goes into a skill or its files.

If your plan does not let you install a plugin, keep the skills in a Project or in your prompt library, and note what stopped you.

Your Task

1. Choose two skills you wrote today, for example the PQQ answer skill and a safety skill.
2. For each one, check the Limits and the Check sections. Make sure a safety skill says it must not decide hazards or controls and ends with a checklist for the competent person.
3. Write a short description for the plugin and a name that says what it is for.
4. Name one owner and a review date. Review at least every three months, because the tools change.
5. Install or save the plugin, then run one test on an invented example.
6. Write down what you must never put into this plugin.

Outcome

You have a plugin or saved set of two skills, with an owner, a review date and a note on what stays out.
