Workshop Worksheet: Architecture Review

Architectural Patterns & Protocols · 14:45 – 16:30

Work in groups. Choose a scenario, sketch a coordination pattern, mark every protocol boundary, name the layer that decides at each one and who owns the server on the other side, and identify the weak hand-off: the same review an architecture board would run before sign-off.

1. Scenario

Scenario chosen (provided or your own)	

> Provided scenarios: **Loan application triage** (eligibility checks against affordability, fraud screening, product eligibility before reaching an underwriter) · **Customer complaint handling** (categorisation, regulatory-reportable check, drafted response, routing, with escalation) · **Internal audit evidence gathering** (evidence pulled from five systems, reconciled, compiled into a draft pack).

2. Pattern chosen

Pattern	☐ Planner-Executor ☐ Orchestrator-Worker ☐ Event-driven agent tree
Why this pattern over the other two	

3. Architecture sketch

Sketch below: boxes for agents, arrows for coordination. Mark each arrow as MCP-shaped (agent→tool), A2A-shaped (agent→agent hand-off), or ACP-shaped (part of a coordinated workflow).

4. Protocol boundaries

Boundary (which arrow)	Type (MCP / A2A / ACP)	Identity presented	What that identity can do	Deciding layer (agent / gateway / policy engine)	Gateway and upstream owner (CSOB / KBC group / third party; via a CSOB gateway?)

If the honest answer in the deciding-layer column is "the agent", write that down: it is a finding. For each decision, also mark whether code, the model or a human makes it (use this morning's four questions).

5. Weak hand-off

Aggregation/hand-off point most likely to fail silently
